

1. New

defined by f

Let:

$$\cdot f : \mathbb{R}^n \rightarrow \mathbb{R}^n$$

Then, $(\mathbb{R}^n, \mathbb{N}, \phi)$ is defined by f if:

$$\cdot \begin{array}{ccc} \phi : \mathbb{R}^n \times \mathbb{N} & \longrightarrow & \mathbb{R}^n \\ & x \longmapsto & f^n(x) \end{array}$$

We denote:

$$\cdot (\mathbb{R}^n, \mathbb{N}, f) \text{ n-D}$$

Henon's application

Let:

$$\cdot \begin{array}{ccc} f : \mathbb{R}^2 & \longrightarrow & \mathbb{R}^2 \\ (x, y) & \longmapsto & (-x^2 + 0.4y, x) \end{array}$$

Study:

$$\cdot \text{Fixed points of } f$$

Demonstration:

$$(0, 0), (-0$$

$$6, -0$$

$$6) \text{ fixed points}$$

Invariant curve

Let:

- γ differentiable curve
- $p \in \mathbb{R}^n$

Then, γ is invariant if:

- $\forall x \in \gamma^* :$
$$o(x) \subset \gamma^*$$

Then, γ is converges to p if:

- $\forall x \in \gamma^* :$
$$o(x) \xrightarrow{n} p$$

Stable & Unstable

Let:

$$\cdot f : \mathbb{R}^n \rightarrow \mathbb{R}^n$$

$$\cdot p \in \mathbb{R}^n \text{ m-periodic point}$$

Then, p is stable if:

$$\cdot \forall \varepsilon \in \mathbb{R}^+ :$$

$$\exists \delta \in \mathbb{R}^+ :$$

$$\forall x \in B(p, \varepsilon) :$$

$$\forall n \in \mathbb{N} :$$

$$f^{nm}(x) \in B(p, \varepsilon)$$

Then, p is unstable if:

$$\cdot p \text{ not stable}$$

Attractive & Repulsive

Let:

$$\cdot f : \mathbb{R}^n \rightarrow \mathbb{R}^n$$

$$\cdot p \in \mathbb{R}^n \text{ m-periodic point}$$

Then, p is attractive if:

$$\cdot p \text{ stable}$$

$$\cdot \exists \varepsilon \in \mathbb{R}^+ :$$

$$\forall x \in B(p, \varepsilon) :$$

$$f^{nm}(x) \xrightarrow{n} p$$

Then, p is repulsive if:

$$\cdot p \text{ attractive by } f^{-1}$$

Invariance of stability over periods

Let:

$$\cdot (\mathbb{R}^n, \mathbb{N}, f) \text{ n-D dynamical system}$$

$$\cdot p \in \mathbb{R}^n \text{ k-periodic point}$$

$$\cdot \chi \text{ character of periodic points}$$

Then, holds:

$$\cdot \exists \sigma \in \text{Im}(\chi) :$$

$$\forall x \in o(p) :$$

$$\chi(x) = \sigma$$

Demonstration:

i will
